Week 1 — Research and Initial Design

We researched the Hybrid Drum project and planned a drumstick interface using piezo and motion sensors. We learned that piezo readings represent relative strike intensity. Next Step: we will develop the circuit schematics and expand the Max patch; hardware assembly remains a current roadblock.

Week 2 — Max Audio Processing and Rhythm Control

We expanded the Max draft with audio processing, a playlist, tap-tempo control, and rhythmic gating, using buttons to simulate drumstick strikes. We learned that tempo changes and rhythmic gating produce different musical effects. Next Step we will test audio playback and refine the controls in Max; the physical drumstick and sensor circuits are still unfinished.
